Weighted-average asset remaining term (months)	65
Weighted-average adjusted interest rate (%)	5.94

^{*}As of the portfolio cut-off date on Nov. 30, 2015.

Transaction Summary

Standard & Poor's Ratings Services has assigned its credit ratings to FCT Ginkgo Compartment Sales Finance 2015-1's class A, B, and C asset-backed fixed- and floating-rate notes. At closing, the issuer also issued unrated class D notes and residual units.

CA Consumer Finance, the originator, is Credit Agricole's wholly owned subsidiary and a major European consumer lender.

The transaction securitizes a portfolio of home equipment and vehicle loan receivables, which CA Consumer Finance granted to private individual borrowers in France.

Our ratings reflect our assessment of the underlying asset portfolio's credit and cash flow characteristics, as well as our analysis of the transaction's exposure to counterparty and operational risks. Our analysis indicates that the available credit enhancement for the class A, B, and C notes is sufficient to mitigate the credit losses that we apply at the currently assigned ratings.

Unlike the most recently rated transactions from the same originator, FCT Ginkgo Compartment PERSONAL LOANS 2015-1, this transaction's securitized pool does not include personal loans or debt consolidation loans.

Since we assigned preliminary ratings to this transaction, the arranger has not made any material structural changes.

Rating Rationale

Our ratings in this transaction reflect our assessment of the following factors:

Originator

We consider CA Consumer Finance to be a leading French consumer loan originator, with tested underwriting and servicing procedures, in our view. It also has securitization experience, and has originated other rated transactions. In our opinion, the originator's ability to service the transaction is satisfactory.

Economic outlook

In our base-case stress scenarios, we have considered the accelerating economic growth of the French economy and improving unemployment forecasts, which we view as key drivers of consumer loan performance (see "Growth In Europe Is On Track, But Geopolitical Risks Have Risen" published on Dec. 2, 2015).

Counterparty risk

Collections could be lost if the servicer becomes insolvent. A commingling reserve fund, partly funded at closing, mitigates commingling risk. If the long-term issuer credit rating on the servicer falls below 'BBB', or if its short-term rating falls below 'A-2', the servicer would increase the commingling reserve fund to two months of scheduled instalments, assuming a stressed monthly prepayment of 1.8%. The transaction also features two fixed- to floating-interest rate swap agreements, which hedge the potential mismatch between the fixed asset yield and floating rate coupons on the class A and B notes.

The swap agreement provisions and other transaction documents' counterparty replacement language are in line with our current counterparty criteria (see "Counterparty Risk Framework Methodology And Assumptions," published on June 25, 2013).

Legal risk

"Fonds Commun de Titrisation" (FCTs) are bankruptcy remote under French securitization law. The seller has to produce a solvency certificate prior to each additional purchase once its rating falls below 'BBB'. This mitigates claw back risk. Since the originator is not a deposit taking institution, there is no depositor set-off risk.

Credit analysis

The pool's credit quality could change during the transaction's 20-month revolving period. We have determined a worst-case scenario for the pool using the documented replenishment conditions and our assumptions for gross and net losses at closing. Our base-case and stress assumptions reflect that the servicer is a repeat issuer and has provided more than 10 years of data. Our assumptions also take into account our view of the improving French economy. We have also considered Banque de France's increasing imposition of over-indebtedness restructuring plans on lenders, which may result in maturity extensions, rate decreases, and principal abandonment. We have analyzed the transaction's exposure to credit risk by applying our European consumer finance criteria and our European auto asset-backed securities (ABS) criteria (see "European Consumer Finance Criteria," published on March 10, 2000, and "Methodology and Assumptions For European Auto ABS," published on Oct. 15, 2015).

Cash flow analysis

A combination of subordination, a fully funded reserve, and available excess spread provide credit enhancement for the notes. Following the application of our European consumer finance criteria, European auto ABS criteria, and our global cash flow criteria, we consider that the results of our credit and cash flow analysis are commensurate with our ratings on the notes (see "Related criteria").

Ratings stability

We analyzed two scenarios and have examined the transaction's performance under our criteria, the results of which are in line with our credit stability criteria (see "Methodology: Credit Stability Criteria," published on May 3, 2010).

Strengths, Concerns, And Mitigating Factors

Strengths

- We consider the portfolio to be highly granular and geographically diversified.
- The portfolio eligibility criteria exclude the purchase of loans that are delinquent, in litigation, or subject to a payment freeze under French consumer overindebtedness law ("Loi Neiertz and Loi Borloo").
- The note repayment structure is purely sequential, and features an acceleration mechanism designed to protect senior noteholders' stakes under adverse circumstances.

Concerns and mitigating factors

- During the transaction's 20-month revolving period, the portfolio characteristics could change and losses may
 occur. Its eligibility criteria ensure that the worst-performing assets do not exceed a certain proportion of the
 portfolio and that the assets' weighted-average adjusted interest rate does not fall below 5.5%.
- The French economy has grown over the last year and employment forecasts have improved—factors that are key

- drivers of consumer loan performance. We have considered this in our base-case assumptions.
- Adverse selection (with higher-yielding loans prepaying faster than the rest of the portfolio) could also occur and reduce the portfolio's yield. To account for this eventuality, we have assumed in our cash flow analysis that 50% of any prepayments apply in priority to the higher-yielding loans.
- Certain receivables are subject to subsidized interest arrangements, whereby car dealers or distributors have agreed to subsidize the rate of interest payable by the borrower when the interest is below market interest rate. The seller has agreed to pay to the compartment these instalments. To mitigate the risk of nonpayment, the seller deposited the outstanding balance of subsidized interest instalments into a dedicated reserve account in the name of the compartment. During the revolving period, the dedicated reserve is replenished up to the outstanding subsidized interest instalments, and the failure to deposit the additional amount constitutes a condition precedent to purchase new receivables.
- There was no contracted back-up servicer at closing. In our cash flow model, we have modeled appropriate stresses regarding a potential servicer replacement, including a stressed servicer fee of 1% per annum.

Transaction Structure

FCT Ginkgo Compartment Sales Finance 2015-1 is a compartment of a French FCT, which is considered bankruptcy remote under French securitization law.

Chart 1 FCT Ginkgo Compartment Sales Finance 2015-1 Transaction structure FCT Ginkgo Compartment Sales Finance 2015-1 Class A Notes Credit Agricole Note proceeds Note proceeds (76.50%)Consumer Finance **Noteholders** Class B Loan (Seller And Notes Loan Receivables Servicer) (6.00%)Note interest receivables And and principal and Class C Ancillary ancillary rights Notes Rights (5.40%)Class D Credit Agricole Notes Consumer (12.10%)Finance Reserve Fund (1.50%)**Euro Titrisation** CACEIS **Credit Agricole** (Management (Paying Agent) Consumer Company) Finance (Compartment Bank Account) @ Standard & Poor's 2015.

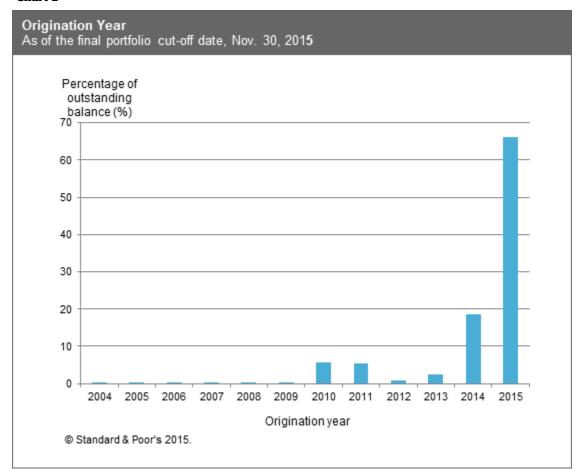

At closing, the FCT used the issuance proceeds to purchase a portfolio of consumer loan receivables granted to private borrowers in France. The issuer pays interest due on the notes monthly in arrears.

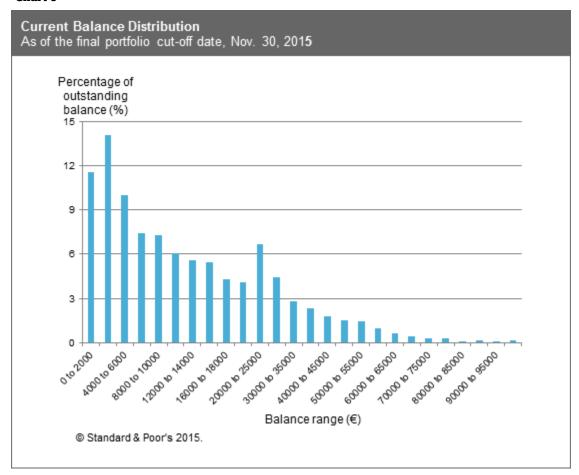

Collateral Description

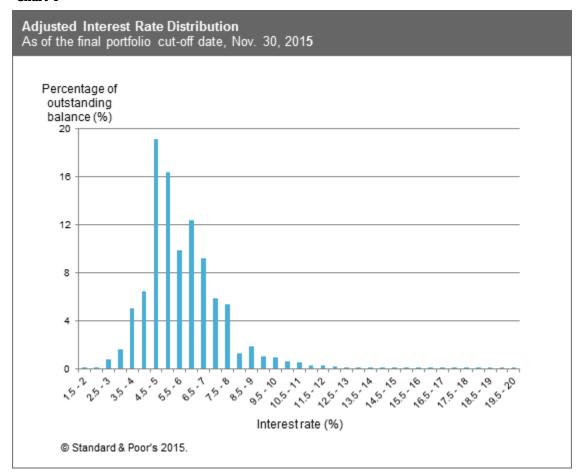

We have reviewed the portfolio with a cut-off date of Nov. 30, 2015 (see table 1). The pool comprises 155,890 consumer loan contracts. All of the loans in the portfolio are fixed-rate and amortizing, with monthly equal installments and granted to private individual borrowers in France.

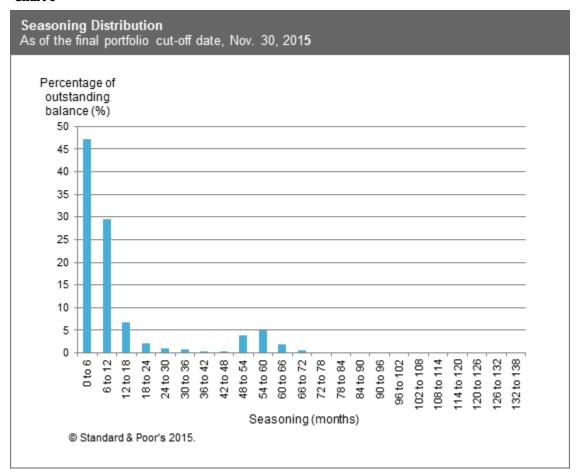

The pool comprises:

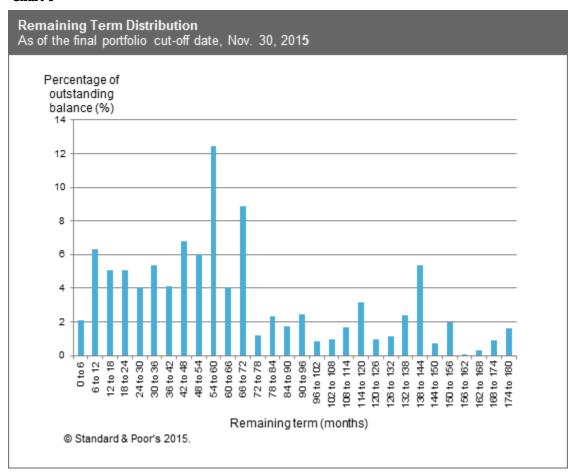

- Home equipment loans;
- · Recreational vehicle loans;
- · New car loans; and
- Used car loans.

Main eligibility criteria

The purchase of loans is subject to the transaction's eligibility criteria, including:

- They cannot be defaulted, granted to an insolvent obligor, or be delinquent;
- They must represent a legally binding obligation of the obligor; and
- They must pay a fixed interest rate and pay fixed monthly installments.

Under the transaction documents, any breach of these criteria would be remedied by the seller, either by indemnification or substitution.

Replenishment criteria

Credit Agricole Consumer Finance's replenishment criteria applicable on each subsequent purchase date are as follows:

- The portfolio's weighted-average adjusted interest rate following the purchase of new loans cannot be lower than 5.5%.
- Used vehicle loans following the purchase of new receivables cannot represent more than 35% of the combined pool balance.
- The sum of the home equipment and recreational vehicle loans cannot represent less than 45% of the total pool

balance.

- The sum of recreational vehicles, new vehicles, and used vehicles produced by a single manufacturer group cannot represent more than 20% of the total pool balance.
- The sum of new vehicles and used vehicles produced by a single manufacturer group cannot represent more than 14% of the total pool balance.
- The aggregate outstanding balance owed by a single borrower is less than €350,000.

We have determined the worst-case scenario for the pool considering the documented replenishment conditions and our base-case assumptions for gross and net losses at closing. In our assumptions, we considered the following pool composition:

Used vehicle loans: 35.0%
Home equipment loans: 45.0%
New vehicle loans: 20.0%

Credit Analysis

Data quality

The originator has provided gross loss data for the four types of loans. We also received recoveries for accelerated (defaulted) loans and overindebtedness.

Default definition

Under the transaction documents, a loan would be considered defaulted if:

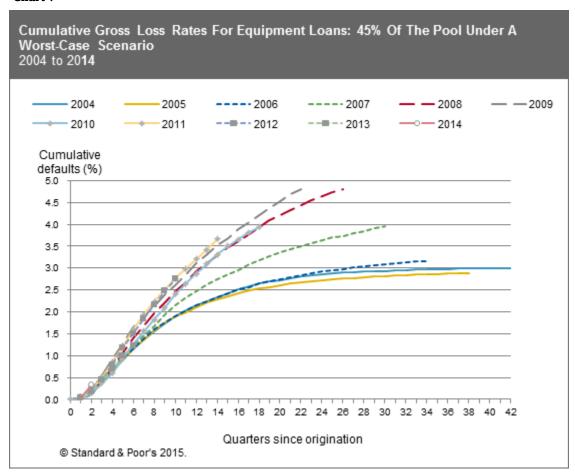

- The loan's servicing has been transferred to the servicer's legal department and the loan is accelerated;
- The loan has eight or more unpaid installments; or
- The borrower has filed a restructuring petition with an over indebtedness committee. This petition has been upheld by the committee and the restructuring of the loan agreement has been enacted (which applies to overindebtedness loans and consumer protection restructured loans).

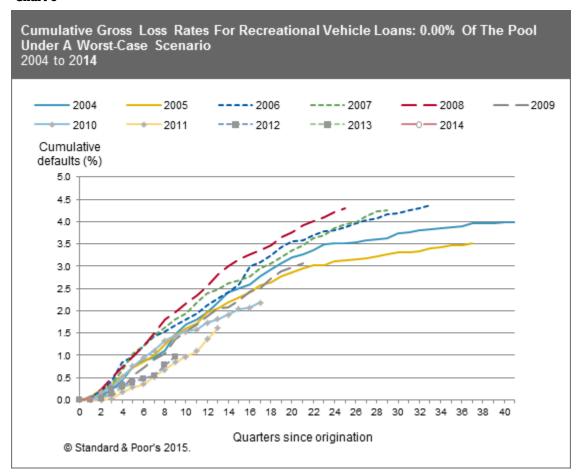

Cumulative default rate base-case assumptions

Home equipment loans: 6.0%Recreational vehicle loans: 5.5%

New vehicles loans: 7.0%Used vehicles loans: 9.0%

These assumptions take our view of the improving French economy into account. Although we received more than 10 years of data, we factored in the relatively better performance of younger vintages originated after 2008.

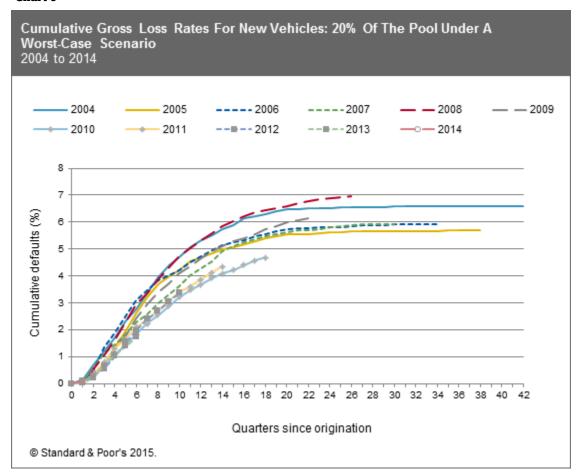

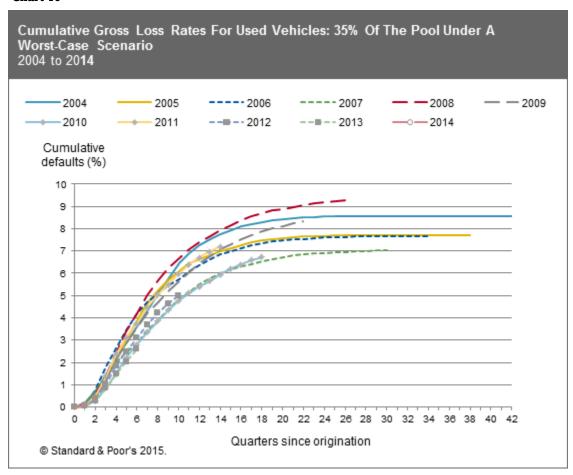

Chart 10

Recovery rate base-case assumptions

Home equipment loans: 37.5%Recreational vehicles loans: 45.0%

New vehicles loans: 45.0%Used vehicles loans: 45.0%

We have assumed that recovery proceeds from each defaulted loan start to come in after 48 months.

Standard & Poor's Stress Test

Summary of credit and stress test assumptions

Table 1

Cumulative Default Rate Stress Test Based On A Worst-Case Composition Of The Pool*

As of the preliminary portfolio cut-off date, Oct. 31, 2015

Loan type	Percentage of the portfolio under a worst-case scenario (%)	Cumulative default rate base-case (%)	'AAA' multiple	'AAA' cumulative default rate assumption (%)	'AA' multiple	'AA' cumulative default rate assumption (%)	'A' multiple	'A' cumulative default rate assumption (%)

^{*}Recovery inflow after 48 months.

Table 3

Stress Test Recap Based On A Worst-Case Composition Of The Pool							
Cumulative default rate (%) Recovery rate (%) Terminal cumulative loss ra							
'AAA' scenario	30.91	23.62	23.61				
'AA' scenario	23.89	25.76	17.73				
'A' scenario	16.86	27.91	12.15				

We based the rating multiple and recovery haircuts on the quality of quarterly data received (more than 10 years of data), the originator's experience of, as well as the originator's experience of the securitization market.

Senior fees

In our cash flow model, we have considered stressed senior expenses of 1% per annum of the outstanding loan balance to take into account a potential servicer replacement.

Default distribution

We have considered equally loaded (linear) defaults over 36 months, starting from month one.

Prepayment and yield compression

We have stressed the prepayment rate up to 24.0% and down to 0.5%.

We have assumed that 50% of the prepayments correspond to the highest-yielding loans, which resulted in the compression of the portfolio's yield (110 basis points [bps] over 36 months).

Interest rates

We have modeled three interest rate scenarios—up, down, and flat—using both high and low prepayment assumptions. Interest rates were close to zero at the time of modeling and we modeled them to rise by 2% per month to a cap of 12% ("up" scenario) and a floor of 0% ("down" scenario). Our modeling considers the impact of the fixed to floating swap agreement which is intended to hedge potential mismatches between asset yield and floating rate coupons on the class A and B notes.

Delinquencies

We have stressed delinquencies in our cash flow analysis by assuming that a proportion of the pool representing two-thirds of the default rate at each rating scenario would be in arrears for six consecutive months for each month during the stressed period.

Credit Structure

Interest on the notes is paid monthly in arrears, with the first payment scheduled for Jan. 18, 2016. The notes can be in one of three payment phases; revolving, normal redemption, or accelerated redemption. The notes are scheduled to revolve for 20 months, during which principal collections from the assets are reinvested in new receivables. The scheduled revolving period is then followed by the normal redemption period. The revolving period may be terminated ahead of schedule if a revolving period termination event occurs. Either the revolving period or normal redemption period may be terminated if an accelerated redemption event occurs.

Revolving period termination events

If any of the following events occur then the notes enter the normal redemption.

- Scheduled end of revolving period;
- A purchase shortfall has occurred (performing balance less than 90% of outstanding balance);
- The delinquency ratio is higher than 4%;
- On any payment date after applying the available interest amounts, the amount in the reserve fund is less than the required amount;
- A seller event of default has occurred which is not cured within the applicable cure period;
- · A servicer termination event; and
- On any calculation date, the class C principal deficiency ledger (PDL) is to remain in debit for the second consecutive payment date.

The final revolving period termination event means that the notes could enter the normal redemption period with a non-zero debit on the PDL. We have considered this in our cash flow modeling.

The legal final maturity of the notes is May 18, 2043. The management company can exercise an option to repay or

clean up the entire outstanding principal under the notes. This can apply if the outstanding principal on the underlying loans is lower than 10% of the original amount, or if all the notes are held by the same party, and that party requests the compartment's liquidation.

The transaction has separate interest and principal payment waterfalls, with a default-based PDL. The transaction can use excess spread to cure incoming defaults on an ongoing basis.

Cash reserve fund

The structure benefits from a fully funded reserve fund, representing 1.5% of the initial principal amount of all classes of notes.

This reserve is split into three sub-ledgers:

- A ledger (0.9%) available to cover the first three items listed below;
- B ledger (0.4%) available to cover the first three items and item six listed below; and
- C ledger (0.2%) available to cover the first three items, and items six and nine listed below.

We estimate that this reserve is sufficient to provide at least six months' worth of liquidity to the transaction in the event of payment disruption caused by servicer termination and replacement.

Interest priority of payments.

During the revolving and normal amortization period, the issuer applies amounts in the interest account to:

- Pay the senior fees;
- Pay any swap net amount or swap termination amount;
- Pay the class A notes' interest;
- Replenish the class A ledger reserve fund up to the required amount (and if it is above the required amount, release the excess);
- Clear the debit on the class A notes' PDL, if any;
- Pay the class B notes' interest;
- Replenish the B ledger reserve fund up to the required amount (and if it is above the required amount, release the excess);
- Clear the debit on the class B notes' PDL, if any;
- Pay the class C notes' interest;
- Replenish the C ledger reserve fund up to the required amount (and if it is above the required amount, release the excess);
- Clear the debit on the class C notes' PDL, if any;
- Pay the interest component purchase price;
- Pay any swap subordinated termination amount;
- Pay the class D notes' interest;
- Pay the junior expenses; and
- Pay interest to units holders.

The FCT can use principal to make up for shortfalls in senior expenses and the class A notes' interest.

The PDL mechanism captures:

- Gross defaults (accelerated loans);
- Loans for which a borrower has filed a restructuring petition with an over indebtedness committee. This petition has been upheld by the committee and the restructuring of the loan agreement has been enacted;
- Non-restructured and non-accelerated loans where eight or more installments remain unpaid (late delinquent receivables); and
- The principal amounts borrowed to pay senior expenses or class A notes' interest shortfalls.

Principal priority of payments

- Unpaid senior expenses and the class A notes' interest in the interest waterfall;
- During the revolving period only, pay the purchase price of receivables;
- During the normal amortization period only, the class A notes' principal;
- During the normal amortization period only, the class B notes' principal; and
- During the normal amortization period only, the class C notes' principal.

Priority of payments during the accelerated redemption period

An acceleration payment waterfall would be effective if the most senior class of notes' interest is not paid within three business days of the due date.

In the accelerated redemption period, there is one single waterfall for interest and principal collections. The notes still amortize principal sequentially as follows:

- Pay the senior fees;
- Pay the swap net amounts;
- Pay the class A notes' interest;
- Fully redeem the class A notes;
- Pay the class B notes' interest;
- Fully redeem the class B notes;
- Pay the class C notes' interest;
- Fully redeem the class C notes;
- Pay any swap subordinated termination amount;
- Pay the class D notes' interest; and
- Pay the class D notes' principal.

Flow of funds and commingling risk

Loan collections are received in collection accounts held with CA Consumer Finance. The servicer transfers collections to the issuer bank account monthly.

If the servicer becomes insolvent, collection proceeds on these collection accounts—including collections received before the borrowers have been notified to redirect their payments—would be lost.

Consequently, a commingling reserve, funded on day one, is available to pay for one month of scheduled collections and prepayment assuming a monthly prepayment rate of 1.6%. If the long-term rating on the servicer falls below 'BBB', or below a short-term 'A-2' rating, this reserve amount would increase to two months of scheduled collections and prepayment, assuming a stressed monthly prepayment rate of 1.8%.

Scenario Analysis

This scenario analysis section incorporates:

- A description of our methodology and scenario stresses;
- · Results of the effects of the stresses on ratings; and
- Results of the effects of the stresses on our cash flow analysis.

Methodology

For rating European auto and consumer ABS transactions, we have developed a scenario analysis and sensitivity-testing model framework. This framework demonstrates the likely effect of scenario stresses on the ratings in a transaction over a one-year outlook horizon. For ABS, we consider scenario stresses over a one-year horizon to be appropriate, given the relatively short weighted-average life of the loans backing the notes. For these types of securities, there are many factors that could cause the downgrade and default of a rated class of notes, including loan performance and structural features. However, for the purposes of this analysis, we have focused on the three fundamental drivers of collateral performance, namely:

- Cumulative default rates,
- · Recovery rates, and
- Prepayment rates.

Given current economic conditions, the proposed stress scenarios reflect negative events for each of these variables. Increases in default rates could arise from a number of factors, including rises in unemployment and company insolvencies. Additionally, these effects would most likely cause collateral recovery rates to fall as the structural imbalance between supply and demand leads to reductions in loan prices. In this environment, we would also expect prepayment rates to fall as fewer refinancing options leave obligors unable to prepay finance agreements.

For this analysis, we have included two stress scenarios to demonstrate the rating transition of a class of notes (see table 5).

Table 4

Scenario Stresses						
Rating variable (%)	Scenario 1 (relative stress to base-case)	Scenario 2 (relative stress to base-case)				
Cumulative default rate	30.0	50.0				
Recovery rate	(30.0)	(50.0)				
Constant prepayment rate	(20.0)	(33.0)				

Our base-case assumptions for each transaction are intended to be best estimates of future performance for the loan portfolio. Our approach in determining these base cases would consider historically observed performance and our expectation of potential changes in these variables over the life of the transaction. The sensitivity of rated classes of notes in each transaction differs depending on these factors, in addition to structural features of the transaction, including reliance on excess spread, payment waterfalls, and levels of credit enhancement at closing.

For each proposed scenario stress, we separate the applied methodology into three distinct stages. In the first stage,

we stress our expected base-case assumptions over a one-year period, to replicate deviations away from our expected performance over the stress horizon. We assume the stresses that we apply occur at closing, with defaults applied based on our expectation of a cumulative default curve for the portfolio.

The second stage applies our usual rating methodology, including revising our base-case assumptions at the one-year horizon, to reflect the assumed deviations as a result of the stressed environment. In the final stage of the analysis, we re-rate the transaction at the one-year horizon, after revising our base-case assumptions and applying our standard credit and cash flow stresses at each rating level. The output of the analysis shows the likely rating transition of the rated class of notes, given the applied stresses and the value and timing of any forecasted principal and interest shortfalls under the most stressful scenario.

Scenario stress and sensitivity analysis

When applying scenario stresses in the manner described above, the results of this modeling are intended to be a simulation of what could happen to the ratings on the notes for the given transaction. For the purposes of our analysis for this transaction, we applied the two scenarios described above in our cash flow modeling (see tables 6, 7, and 8).

Table 5

٠.							
	Scenario Stresses						
	Stress horizon12 months						
	Rating variable (%)	Base-case	Scenario 1	Scenario 2

Scenario 2	В	AA	A		
Scenario 1	С	A	A		
Scenario 2	С	A	A		

Monitoring And Surveillance

As part of our ongoing surveillance of this transaction, we will regularly assess:

- The performance of the underlying portfolio, including defaults, delinquencies, and prepayments;
- The supporting ratings in the transaction; and
- The servicer's operations and its ability to maintain minimum servicing standards.

While S&P has obtained information from sources it believes to be reliable, S&P does not perform an audit and undertakes no duty of due diligence or independent verification of any information it receives.

To the extent that regulatory authorities allow a rating agency to acknowledge in one jurisdiction a rating issued in another jurisdiction for certain regulatory purposes, S&P reserves the right to assign, withdraw, or suspend such acknowledgement at any time and in its sole discretion. S&P Parties disclaim any duty whatsoever arising out of the assignment, withdrawal, or suspension of an acknowledgment as well as any liability for any damage alleged to have been suffered on account thereof.

S&P keeps certain activities of its business units separate from each other in order to preserve the independence and objectivity of their respective activities. As a result, certain business units of S&P may have information that is not available to other S&P business units. S&P has established policies and procedures to maintain the confidentiality of certain nonpublic information received in connection with each analytical process.

S&P may receive compensation for its ratings and certain analyses, normally from issuers or underwriters of securities or from obligors. S&P reserves the right to disseminate its opinions and analyses. S&P's public ratings and analyses are made available on its Web sites, www.standardandpoors.com (free of charge), and www.ratingsdirect.com and www.globalcreditportal.com (subscription) and www.spcapitaliq.com (subscription) and may be distributed through other means, including via S&P publications and third-party redistributors. Additional information about our ratings fees is available at www.standardandpoors.com/usratingsfees.
